WHERE'S WALLDO DOCUMENTATION

Project Description:

Where's Walldo's software is in an all encompassing software developed for the purpose of having a fully functional website dedicated to the purchase of household goods as well as their speedy delivery to the customers. From a visiting customer's point of view the project includes a brief description of the sites goals, fast access to locate individual packages, warehouse locations, employment opportunities, a FAQ help page and a signup/registration page. From a signed up customer's view the software allows for placing orders, checking the location of multiple orders, and viewing account information. From the admin point of view there is added functionality of login in to view administration pages such as revenue, orders placed and customer feedback.

Installation Instructions:

Pay for a domain name, install the files from the repository, and upload the files and database to produce the functioning website.

Alternative Instructions:

You can also run the website off of a local machine without paying for a domain by running a form of local web server application (we used XAMPP). Include the files into the root directory of the web server and then using a browser put the file path to the project.

Known Issues:

No known local machine issues, but certain uploading files to domain hosts can cause issues within the website, such as issues displaying the cart and sending verification emails, as the settings aren't as customizable.

API/Code Documentation:

Most code that was written for the website was CSS, HTML based for design, and PhP for functionality. Some Javascript was used for functions such as the cart. We attempted to use the Google Matrix API, but ended up brute forcing the information ourselves, because there were issues.
